

## Hospitals Report Jump in ER Visits Related to Meth

Tuesday, 24 June 2014 17:36

---

U.S. emergency departments reported a sharp increase in methamphetamine-related visits between 2007 and 2011, according to a new government report.

The report "shows that methamphetamine use may be on the rise again, and we must do everything we can to address this serious public health problem," Dr. H. Westley Clark, Director of the Substance Abuse and Mental Health Services Administration's (SAMHSA) Center for Substance Abuse Treatment, said in a news release.

The SAMHSA report found meth-related visits increased from about 68,000 in 2007, to almost 103,000 in 2011—the latest year for which data is available, *HealthDay* reports.

ER visits related to meth had significantly decreased between 2005 and 2007, the article notes.

Meth-related ER visits increased sharply among people ages 25 to 34 and those 55 and older. The report found in 2011, 62 percent of meth-related ER visits also involved other drugs. Marijuana was the drug most likely to be combined with meth, followed by alcohol.

"One important step is to use the hospital emergency department visit as a critical opportunity to talk to, and intervene with, people using this drug so that they can more fully understand its dangers and where they can turn to for help," Clark noted.

Meth has a high potential for abuse and addiction, according to SAMHSA. The drug can lead to a range of physical and mental health issues, including severe dental problems, anxiety, confusion, insomnia, mood changes, and violent behaviors.
